

b. 曲げ耐力

式 #11 (14.29) 式 #11. 使用の A_s, A_s' を決定すると曲げ耐力は.

$$C = T \neq 1 \quad \alpha k b d \sigma_s^* + \frac{A_s' \sigma_s^*}{k \phi} = A_s \sigma_s^* \quad (14.31)$$

$$\phi = \frac{\sigma_s^*}{\sigma_s'} = \frac{k - a_s'}{k - a_s} \frac{\epsilon_s^*}{\epsilon_s} \geq 1 \quad (14.33)$$

$$\frac{\alpha k}{m^*} + \frac{\phi}{\psi} = \rho \quad m^* = \frac{\sigma_s^*}{\sigma_c^*}$$

$$k = \frac{m^*}{\alpha} \left(\rho - \frac{\rho'}{\phi} \right)$$

$$\rho_0 = \rho - \frac{\rho'}{\phi} \quad \rho_0 \leq \rho \quad (14.32)$$

$$k = \rho_0 m^* / \alpha$$

$$\epsilon_s = \epsilon_s^* \quad \text{かつ} \quad k = k^* \quad \text{かつ} \quad \rho_0 = \rho_0^*$$

$$\rho_0^* = \frac{\alpha k^*}{m^*}$$

$$\rho_0 \leq \rho_0^* \quad \text{かつ} \quad \epsilon_s \geq \epsilon_s^*, \quad \sigma_s = \sigma_s^* \quad \text{かつ} \quad 1$$

$$\rho = \frac{\rho_0 m^*}{\alpha}$$

$$\begin{aligned} M_B &= C_c \cdot d (1 - \beta k) + C_s (d - d') \\ &= \left(A_s \sigma_s^* - \frac{A_s' \sigma_s^*}{\phi} \right) d (1 - \beta k) + \frac{A_s' \sigma_s^*}{\phi} (d - d') \\ &= \rho_0 b d^2 \sigma_s^* (1 - \beta k) + \rho' b d^2 \frac{\sigma_s^*}{\phi} (1 - a_s') \end{aligned}$$

$$\alpha = 0.8 \quad \beta = 0.4 \quad (14.35)$$

上式で ρ_0 式の中 ϕ は k の関数故、 $\phi = 1$ と仮定して、
繰返算等により k を決定する必要があります
